Abstract— The intent of this paper is to conjure a reflexive real-time spotting of thrombosis in the femoral nerve. This paper exhibits blood clot recognition model of the ultrasound (US) femoral nerve images using the techniques of active contour, shape based geometric boundary descriptors and texture based local descriptors. Specially, Local Mesh Pattern (LMeP) and Gray-Level Co-occurrence Matrix (GLCM) are amalgamated as a novel texture based local descriptor called Local Mesh Co-occurrence Pattern (LMCoP). It is decidedly used to extract the local directional information from the US image. By enforcing Random Forest (RF) classifier model; the severity of the thrombus is automatically classified. The classifiers performance were studied and compared.

Keywords—medical imaging; femoral nerve; active contour; local mesh co-occurrence pattern; random forests

I. INTRODUCTION

The scurrying growth of medical imaging technologies is modernizing the field of medicine. With the achievability of actual life-saving anatomical reference information, the images acquired from the imaging devices become the main resources of medical specialists and researchers. The femoral nerve is the primary nerve that serves the tissues of the thigh and leg, together with the muscles and skin. The top portion of the Fig.1 exemplifies the cross-section of the thigh. The Bottom of the Fig.1 shows the manual remarks outlined by a specialist to dissociate the location of the nerve. Nerve signals passed by the femoral nerve are very important to the function of the legs, including standing, walking, and running. Nearby of the groin region, femoral artery goes through the femoral vein and femoral nerve, by drawing up a delta shape. This branch is renowned as a femoral triangle. The femoral triangle works as an essential anatomical reference for operating surgeon when surgical process inevitably to be done in the

location. While a piece of thrombus or a blood clog in the profound venous system of the leg glaciates or move through the arterial blood stream, through and through the heart, and into the artery pulmonary, the condition of the patient becomes critical by forming a pulmonary embolism. Hence, screening for Deep Vein Thrombosis (DVT) currently forms an integral part of lots of surgical procedures in recent health care services. Patients at high risk and symptomatic patients are regularly scanned on the lookout for blood clots or thrombi in the deep veins. Though Thrombus can indeed exist in all of the deep veins of the entire body, it is widely appeared in the legs. At last, the creation of a venous thrombosis produces the changes in blood coagulation, alteration in the vein wall and modification in the speed of the blood flow in the vein particularly in stasis. The economy class syndrome is not only the reason; many causes are there for severe blood clots.

Celebrating 15 years of Excellence

NCET-2017

NATIONAL CONFERENCE ON EMERGING TECHNOLOGIES-2017

CERTIFICATE OF PARTICIPATION

This is to Certify that Mr/Ms/Mrs/Dr MAHESH.M, AP/ECE
participated and presented the Paper titled POTHLES AND UNEVEN SURFACE DETECTION
TO ASSIST VISUALLY IMPAIRED USING ULTRASONIC SENSOR.

in the NCET-2017(NATIONAL CONFERENCE ON EMERGING TECHNOLOGIES-2017) held at
Arunai College of Engineering, Tiruvannamalai, March 11, 2017.
